

Bug Report

DELETE Request on Non-Existent Event ID Returns a Success Response

Reported by: Muki

Date: July 2, 2026

Environment: Local (manual testing via Postman)

Endpoint: DELETE /events/{id}

Severity: Medium

Priority: Medium

Precondition

- No event with the given {id} exists in the database (either it was never created, or it was already deleted).

Steps to Reproduce

- 1 Set HTTP Method to DELETE.
- 2 Set Endpoint URL to /events/{id}, using an ID that does not exist in the database.
- 3 Add Header: Authorization: Bearer <valid_token>.
- 4 Send Request.

Actual Result

- The API returns a success response (e.g., 200 OK / 204 No Content) with a message indicating the event was successfully deleted – even though no such event exists.

Expected Result

- The API should return 404 Not Found, along with an error message indicating that the event with the given ID does not exist.

Additional Notes

- This is misleading for API consumers, since they cannot distinguish between “successfully deleted” and “nothing was there to delete.”
- Suggest verifying the ID exists in the database before returning a success response.

Attachments

- Postman screenshot showing the request and response (to be added).
